Advances in materials science and engineering have paved the way for the development of new and more capable sensors. Drawing upon case studies from manufacturing and structural monitoring and involving chemical and long wave-length infrared sensors, this book suggests an approach that frames the relevant technical issues in such a way as to expedite the consideration of new and novel sensor materials. It enables a multidisciplinary approach for identifying opportunities and making realistic assessments of technical risk and could be used to guide relevant research and development in sensor technologies.

Chemistry in Context

This book takes a fresh look at programs for advanced studies for high school students in the United States, with a particular focus on the Advanced Placement and the International Baccalaureate programs, and asks how advanced studies can be significantly improved in general. It also examines two of the core issues surrounding these programs: they can have a profound impact on other components of the education system and participation in the programs has become key to admission at selective institutions of higher education. By looking at what could enhance the quality of high school advanced study programs as well as what precedes and comes after these programs, this report provides teachers, parents,

curriculum developers, administrators, college science and mathematics faculty, and the educational research community with a detailed assessment that can be used to guide change within advanced study programs.

Instruction and assessment are so common to teaching and learning that for many readers this may be second nature. There are certainly many kinds of instruction and assessment available to instructors, and these are chosen based on many factors. Thinking beyond standard content tests, considering other, innovative assessments, we may enjoy a richer picture of what students know or understand by investigating prior knowledge, misconceptions, motivations, or self-concept. The book is organized into four general sections: the first section describes the processes by which assessments are constructed and used. The second section focuses on what is learned from assessments in an informal environment, including the use of practice exams and feedback provided to help students reflect on their own learning. Formal classroom assessments and the decisions associated with different assessments and techniques comprises the third section. The final section focuses on assessment goals and innovative investigations of student learning with descriptions of new assessments and new online tools for measuring

student understanding.

Although the difficulties many students encounter when learning chemistry have been known and explored for decades, there is no consensus on how best to assist and assess their learning. Over the past ten years, the availability of a range of technological innovations that are intended to improve student learning and assessment has made the choice of teaching and assessment strategies more complex. Many teachers are rapidly adopting new technologies in teaching and assessment although their impacts have not yet been extensively studied. Many researchers have investigated the use of specific technologies in aspects of their teaching and assessment, and this book contributes to a growing body of literature that allows some generalizations to be drawn. Most importantly, specific strategies are described in detail making it possible for others to take advantage of the learning experiences and allowing practitioners to adopt the practice best suited to their needs. General tools for chemistry education range from tailored websites (including Web 2.0 interactive features), to optimizing the use of flipped classrooms, to the application of commercial packages in a coherent manner. The book focuses on these aspects of using technology directly in teaching chemistry. One area of great interest in chemistry education is the role of the teaching laboratory and how best to optimize laboratory learning. The use of

short videos, animations, and best assessment practices are also covered. The chapters in the book reflect the somewhat different teaching contexts of the countries in which the authors work.

Over the last decade, scientific and engineering interests have been shifting from conventional ion mobility spectrometry (IMS) to field asymmetric waveform ion mobility spectrometry (FAIMS). *Differential Ion Mobility Spectrometry: Nonlinear Ion Transport and Fundamentals of FAIMS* explores this new analytical technology that separates and characterizes ions by the difference between their mobility in gases at high and low electric fields. It also covers the novel topics of higher-order differential IMS and IMS with alignment of dipole direction. The book relates the fundamentals of FAIMS and other nonlinear IMS methods to the physics of gas-phase ion transport. It begins with the basics of ion diffusion and mobility in gases, covering the main attributes of conventional IMS that are relevant to all IMS approaches. Building on this foundation, the author reviews diverse high-field transport phenomena that underlie differential IMS. He discusses the conceptual implementation and first-principles optimization of FAIMS as a filtering technique, emphasizing the dependence of FAIMS performance metrics on instrumental parameters and properties of ion species. He also explores ion reactions in FAIMS caused by field heating and the effects of inhomogeneous electric field in curved FAIMS gaps. Written by an accomplished scientist in the field, this state-of-the-art book supplies the foundation to

understand the new technology of nonlinear IMS methods.

A crucial issue for antiviral therapy is the fact that all antiviral substances rapidly select for resistance; thus, monitoring and overcoming resistance has

become a most important clinical paradigm of antiviral therapy. This calls for cautious use of antiviral drugs and implementation of combination therapies. In parallel, efforts in drug discovery have to be continued to develop compounds with novel mode-of-action and activity against resistant strains. This book reviews the current status of antiviral therapy, from the roads to development of new compounds to their clinical use and cost effectiveness. Individual chapters address in more detail all available drug classes and outline new approaches currently under development.

Process Oriented Guided Inquiry Learning (POGIL) is a pedagogy that is based on research on how people learn and has been shown to lead to better student outcomes in many contexts and in a variety of academic disciplines. Beyond facilitating students' mastery of a discipline, it promotes vital educational outcomes such as communication skills and critical thinking. Its active international community of practitioners provides accessible educational development and support for anyone developing

related courses. Having started as a process developed by a group of chemistry professors focused on helping their students better grasp the concepts of general chemistry, The POGIL Project has grown into a dynamic organization of committed instructors who help each other transform classrooms and improve student success, develop curricular materials to assist this process, conduct research expanding what is known about learning and teaching, and provide professional development and collegiality from elementary teachers to college professors. As a pedagogy it has been shown to be effective in a variety of content areas and at different educational levels. This is an introduction to the process and the community. Every POGIL classroom is different and is a reflection of the uniqueness of the particular context – the institution, department, physical space, student body, and instructor – but follows a common structure in which students work cooperatively in self-managed small groups of three or four. The group work is focused on activities that are carefully designed and scaffolded to enable students to develop important concepts or to deepen and refine their understanding of those ideas or concepts for themselves, based entirely on data provided in class, not on prior reading of the textbook or other introduction to the topic. The learning environment is structured to support the development of process skills -- such as teamwork, effective communication, information processing, problem solving, and critical thinking. The instructor's role is to facilitate the development of student concepts and process skills, not to simply deliver content to the students. The first part of this book introduces the theoretical and

philosophical foundations of POGIL pedagogy and summarizes the literature demonstrating its efficacy. The second part of the book focusses on implementing POGIL, covering the formation and effective management of student teams, offering guidance on the selection and writing of POGIL activities, as well as on facilitation, teaching large classes, and assessment. The book concludes with examples of implementation in STEM and non-STEM disciplines as well as guidance on how to get started. Appendices provide additional resources and information about The POGIL Project.

Assessment is a value-laden activity surrounded by debates about academic standards, preparing students for employment, measuring quality and providing incentives. There is substantial evidence that assessment, rather than teaching, has the major influence on students' learning. It directs attention to what is important and acts as an incentive for study. This book revisits assessment in higher education, examining it from the point of view of what assessment does and can do and argues that assessment should be seen as an act of informing judgement and proposes a way of integrating teaching, learning and assessment to better prepare students for a lifetime of learning. It is essential reading for practitioners and policy makers in higher education institutions in different countries, as well as for educational development and institutional

research practitioners.
