Until now, there has only been a shallow understanding of how the leadership actions of project managers interact with ethics and social responsibility. Empirical research into this subject has been sparse. *Responsible Leadership*, by Nicholas Clarke, Alessia D'Amato, Malcolm Higgs, and Ramesh Vahidi is the first study to investigate how the relationships among managers, team members, and other stakeholders can bring about personal and ethical conflicts that impact decision making. In this groundbreaking book, the authors explore how those who serve as leaders on projects can exercise their roles in ways that respond to the ever-increasing need for ethical decision making. They examine the factors that enable and constrain responsible leadership, looking at the issues faced by project managers as they interact with team members and other stakeholders. *Responsible Leadership* also provides new insights into how project managers view the moral implications of conflicts that occur as they conduct their work and is a valuable addition to the project management toolkit.

Incivility Among Nursing Professionals in Clinical and Academic Environments

When Charles Darwin, then age 22, first saw the HMS Beagle, he thought it looked "more like a wreck than a vessel commissioned to go round the world." But travel around the world it did, taking Darwin to South America, Australia, New Zealand, Tahiti, and of course the Galapagos Islands, in a journey of discovery that lasted almost five years. Now, in *Fossils, Finches and Fuegians*, Richard Keynes, Darwin's

great grandson, offers the first modern full-length account of Darwin's epoch-making expedition. This was the great adventure of Charles Darwin's life. Indeed, it would have been a great adventure for anyone--tracking condor in Chile, surviving the great earthquake of 1835, riding across country on horseback in the company of gauchos, watching whales leaping skyward off Tierra del Fuego, hunting ostriches with a bolo, discovering prehistoric fossils and previously unknown species, and meeting primitive peoples such as the Fuegians. Keynes captures many of the natural wonders that Darwin witnessed, including an incredible swarm of butterflies a mile wide and ten miles long. Keynes also illuminates Darwin's scientific work--his important findings in geology and biology--and traces the slow revolution in Darwin's thought about species and how they might evolve. Numerous illustrations--mostly by artists who traveled with Darwin on the Beagle--grace the pages, including finely rendered drawings of many points of interest discussed in the book. There has probably been no greater or more important scientific expedition than Darwin's voyage on the Beagle. Packed with colorful details of life aboard ship and in the wild, here is a fascinating portrait of Charles Darwin and of 19th century science.

Concise Guide to APA Style

"This is a book about the most admirable of human virtues--courage. 'Grace under pressure,' Ernest Hemingway defined it. And these are the stories of the pressures experienced by eight United States Senators and the grace with which they endured them." -- John F. Kennedy During 1954-55, John F. Kennedy, then a U.S. Senator, chose eight of his historical colleagues to profile for their acts of astounding integrity in the face of overwhelming opposition. These heroes include John Quincy Adams, Daniel Webster, Thomas Hart Benson, and Robert A. Taft. Awarded the Pulitzer Prize in 1956, Profiles in Courage resounds with timeless lessons on the most cherished of virtues and is a powerful reminder of the strength of the human spirit. It is, as Robert Kennedy states in the foreword, "not just stories of the past but a book of hope and confidence for the future. What happens to the country, to the world, depends on what we do with what others have left us.

During the last years computational methods lead to new approaches that can be applied within medical practice. Based on the tremendous advances in medical imaging and high-performance computing, virtual testing is able to help in medical decision processes or implant designs. Current challenges in medicine and engineering are related to the application of computational methods to clinical medicine and the study of biological systems at different scales. Additionally manufacturers will be able to use computational tools and methods to predict the performance of their medical devices in virtual patients. The physical and animal testing procedures could be reduced by virtual prototyping of medical devices. Here simulations can enhance the performance of alternate device designs for a range of virtual patients. This will lead to a refinement of designs and to safer products. This book summarizes different aspects of approaches to enhance function, production, initialization and complications of different types of implants and related topics.

The Practice of Everyday Life

"This book offers practical guidance for understanding and implementing the American Psychological Association's Journal Article Reporting Standards for Quantitative Research (JARS-Quant) and Meta-Analysis Reporting Standards (MARS). These standards lay out the essential pieces information researchers need to report, including detailed accounts of the methods they followed, data results and analysis, interpretations of their findings, and implications for future research. The book reflects updates to the original JARS and the MARS that meet researchers' developing needs in the behavioral, social, educational, and medical sciences. It analyzes examples from APA journals, offering readers easy-to-read advice for implementing these revised standards in their own writing while also conforming with the APA Style guidelines laid out in the sixth edition of the Publication Manual. New and expanded chapters offer more detailed guidelines for reporting statistical analyses and unique elements of different types of research, including replication studies, clinical trials, and observational studies. This book is essential reading for experienced and early career researchers alike, as well as undergraduate and graduate students in research methods classes. It presents what JARS recommends for information to include in all reports on new quantitative data collections, and addresses the material that appears first in a research manuscript. It also describes the Method section, presents the JARS standards for reporting basic research designs and covers the general reporting requirements for the statistical results of studies with multiple participants in each condition."--Preface. Biomedical Technology

Why do we do the things we do? Over a decade in the making, this game-changing book is Robert Sapolsky's genre-shattering attempt to answer that question as fully as perhaps only he could, looking at it from every angle. Sapolsky's storytelling concept is delightful but it also has a powerful intrinsic logic: he starts by looking at the factors that bear on a person's reaction in the precise moment a behavior occurs, and then hops back in time from there, in stages, ultimately ending up at the deep history of our species and its genetic inheritance. And so the first category of explanation is the neurobiological one. What goes on in a person's brain a second before the behavior happens? Then he pulls out to a slightly larger field of vision, a little earlier in time: What sight, sound, or smell triggers the nervous system to produce that behavior? And then, what hormones act hours to days earlier to change how responsive that individual is to the stimuli which trigger the nervous system? By now, he has increased our field of vision so that we are thinking about neurobiology and the sensory world of our environment and endocrinology in trying to explain what happened. Sapolsky keeps going--next to what features of the environment affected that person's brain, and then back to the childhood of the individual, and then to their genetic makeup. Finally, he expands the view to encompass factors larger than that one individual. How culture has shaped that individual's group, what ecological factors helped shape that culture, and on and on, back to evolutionary factors thousands and even millions of years old. The result is one of the most dazzling tours de horizon of the science of human behavior ever attempted, a majestic synthesis that harvests cutting-edge research across a range of disciplines to provide a subtle and nuanced perspective on why we ultimately do the things we do for good and for ill. Sapolsky builds on this understanding to wrestle with some of our deepest and thorniest questions relating to tribalism and xenophobia, hierarchy and competition, morality and free will, and war and peace. Wise, humane, often very funny, Behave is a towering achievement, powerfully humanizing, and downright heroic in its own right.

Careers in astronomy for women (as in other sciences) were a rarity in Britain and Ireland until well into the twentieth century. The book investigates the place of women in astronomy before that era, recounted in the form of biographies of about 25 women born between 1650 and 1900 who in varying capacities contributed to its progress during the eighteenth, nineteenth and early twentieth centuries. There are some famous names among them whose biographies have been written before now, there are others who have received less than their due recognition while many more occupied inconspicuous and sometimes thankless places as assistants to male family members. All deserve to be remembered as interesting individuals in an earlier opportunity-poor age. Placed in roughly chronological order, their lives constitute a sample thread in the story of female entry into the male world of science. The book is aimed at astronomers, amateur astronomers, historians of science, and promoters of women in science, but being written in non-technical

language it is intended to be of interest also to educated readers generally.
