The OpenVMS User's Guide

Computer security is an ongoing process, a relentless contest between system administrators and intruders. A good administrator needs to stay one step ahead of any adversaries, which often involves a continuing process of education. If you're grounded in the basics of security, however, you won't necessarily want a complete treatise on the subject each time you pick

up a book. Sometimes you want to get straight to the point. That's exactly what the new Linux Security Cookbook does. Rather than provide a total security solution for Linux computers, the authors present a series of easy-to-follow recipes--short, focused pieces of code that administrators can use to improve security and perform common tasks securely. The Linux Security Cookbook includes real solutions to a wide range of targeted problems, such as sending encrypted email within Emacs, restricting access to network services at particular times of day, firewalling a webserver, preventing IP spoofing, setting up key-based SSH authentication, and much more. With over 150 ready-to-use scripts and configuration files, this unique book helps administrators secure their systems without having to look up specific syntax. The book begins with recipes devised to establish a secure system, then moves on to secure day-to-day practices, and concludes with techniques to help your system stay secure. Some of the "recipes" you'll find in this book are: Controlling access to your system from firewalls down to individual services, using iptables, ipchains, xinetd, inetd, and more Monitoring your network with tcpdump, dsniff, netstat, and other tools Protecting network connections with Secure Shell (SSH) and stunnel Safeguarding email sessions with Secure Sockets Layer (SSL) Encrypting files and email messages with GnuPG Probing your own security with password crackers, nmap, and handy scripts This cookbook's proven techniques are derived from hard-won experience. Whether you're responsible for security on a home Linux system or for a large corporation, or somewhere in between, you'll find valuable, to-the-point, practical recipes for

dealing with everyday security issues. This book is a system saver.

Writing Real Programs in DCL

This unique volume is a case study of a successful and innovative program using case aide volunteers to deinstitutionalize mental patients. It will serve as an important reference for professionals, teachers, and administrators who are involved in the "business" of human services and require concrete information on how to develop effective volunteer programs to bridge the widening gap between services and needs. The authors use their particular program as an empirical blueprint for principles undergirding the successful use of volunteers as extensions of professional social service staff. The case-aide handbook appended to the volume provides a "quick prescription" formula for how this volunteer program was made viable and how these techniques can be

adapted to other programs. In the new and enlarged edition of *The New Volunteerism*, the authors tell about "whatever happened to" the case aides in their program, based on the responses to a questionnaire they designed and mailed to 100 of these men and women. Models for Volunteer/Professional Partnerships are defined and illustrated with creative and innovative volunteer programs reviewed by Feinstein and Cavanaugh. These programs serve many different populations, including: alcoholics, the elderly, the mentally ill, the retarded, abusive parents, and the terminally ill.

Terrible Nerd

Racially Writing the Republic investigates the central role of race in the construction and transformation of American national identity from the Revolutionary War era to the height of the civil rights movement. Drawing on political theory, American studies, critical race theory, and gender studies, the contributors to this collection highlight the assumptions of white (and often male) supremacy underlying the thought and actions of major U.S. political and social leaders. At the same time, they examine how nonwhite writers and activists have struggled against racism and for the full realization of America's political ideals. The essays are arranged chronologically by subject, and, with one exception, each essay is focused on a single figure, from George Washington to James Baldwin. The contributors analyze Thomas Jefferson's legacy in light of his sexual relationship with his slave, Sally Hemings; the way that Samuel Gompers, the first

president of the American Federation of Labor, rallied his organization against Chinese immigrant workers; and the eugenicist origins of the early-twentieth-century birth-control movement led by Margaret Sanger. They draw attention to the writing of Sarah Winnemucca, a Northern Piute and one of the first published Native American authors; the anti-lynching activist Ida B. Wells-Barnett; the Filipino American writer Carlos Bulosan; and the playwright Lorraine Hansberry, who linked civil rights struggles in the United States to anticolonial efforts abroad. Other figures considered include Alexis de Tocqueville and his traveling companion Gustave de Beaumont, Juan Nepomuceno Cortina (who fought against Anglo American expansion in what is now Texas), Abraham Lincoln, Theodore Roosevelt, and W. E. B. Du Bois. In the afterword, George Lipsitz reflects on U.S. racial politics since 1965. Contributors. Bruce Baum, Cari M. Carpenter, Gary Gerstle, Duchess Harris, Catherine A. Holland, Allan Punzalan Isaac, Laura Janara, Ben Keppel, George Lipsitz, Gwendolyn Mink, Joel Olson, Dorothy Roberts, Patricia A. Schechter, John Kuo Wei Tchen, Jerry Thompson

Presenting the fundamentals of machine language programming on the Atari 800 XL and 130 XE computers, this book discusses 6502 instruction set, 6502 programming, sound and graphics and I/O programming. Ideal for the those with a working knowledge of BASIC but with little or no assembly language experience.

Zen of Assembly Language: Knowledge

Ballistic Materials and Penetration Mechanics deals with ballistically protective materials and penetration mechanics. The book discusses historical and practical considerations of ballistic protection, including metallic armor, as well as ballistic testing methodology, the ability of a protective material to stop or slow down a particular projectile, and the theoretical aspects of penetration mechanics. It also highlights the importance of stress wave analysis in the penetration and spalling phenomena. Organized into 12 chapters, this volume begins with an overview of the history of the armor and the modern helmet. It proceeds with a discussion of variations in ballistic test methods, errors in test methods, and the importance of the hardness and geometry of both the target and the projectile. The next chapters focus on the importance of fibrous armor, materials that are visually transparent and resistant to penetration by high-energy projectiles and fragments, and transparent armor and ceramic composite armor. The reader is also introduced to materials used in the design of metallic armor, the role of stress waves in the penetration problem, and the use of computer simulation to analyze ballistic impact experiments. The book looks at numerical techniques for modeling hypervelocity impact and concludes with a chapter on the penetration mechanics of textile structures. This book is a valuable resource for scientists working at government, industrial, and university laboratories, as well as law enforcement officers and others who want information on materials that provide the best protection against damage from impacts, explosions, and bullets.
