Testing matters! It can determine kids' and schools' futures. In a conference at the Mathematical Sciences Research Institute, mathematicians, maths education researchers, teachers, test developers, and policymakers gathered to work through critical issues related to mathematics assessment. They examined: the challenges of assessing student learning in ways that support instructional improvement; ethical issues related to assessment, including the impact of testing on urban and high-poverty schools; the different (and sometimes conflicting) needs of the different groups; and different frameworks, tools, and methods for assessment, comparing the kinds of information they offer about students' mathematical proficiency. This volume presents the results of the discussions. It highlights the kinds of information that different assessments can offer, including many examples of some of the best mathematics assessments worldwide. A special feature is an interview with a student about his knowledge of fractions and a demonstration of what interviews (versus standardized tests) can reveal.

Our students aren't learning, we're falling behind other countries, and many of our college graduates are even functionally illiterate. We offer our kids a weak and poorly thought out curriculum; too many teachers do not make good use of classroom time and follow lesson plans that are superficial and repetitive; almost all state governments define "proficiency" at low levels of competency; and because kids with very uneven skills populate a classroom, teachers spend considerable time on review before introducing new material. This dismal picture is tempered by the fact that the hard work and dedication of countless teachers and administrators means that many students get an excellent education. But it doesn't temper it much. As a group, even our top students are not as strong as are those in a large majority of other rich countries. But it doesn't have to be this way. Katherine Baird, an economist, starts by clearly spelling out how our educational system is trapped in mediocrity. Yet, she doesn't just expose where we are. She identifies the steps to get out of the trap. We need to (1) dramatically reform our education's governance structure, (2) establish high expectations

for all students, (3) provide adequate support to meet those expectations, and (4) introduce strong incentives for students to work hard in school so they do their part in meeting higher standards. Clearly, it isn't as simple as it sounds, but Baird carefully examines each factor that has led to the current state in education and then spells out how a combination of policies will weaken the forces that keep our schools mediocre and instead make them ones worth copying

Setting standards of performance is a ubiquitous task in education licensure, certification, and credentialing. It is found in elementary schooling, the professions, commercial applications, and governmental and private organizations. It is one of the most complex, controversial, and vexing issues facing specialists and policy makers today. This second edition solidifies Setting Performance Standards as the only book providing a comprehensive profile of both the issues and the "how-to" methods that define this thorny field. Four chapters have been removed; 11 chapters have been added; 2 chapters have major revisions; and all chapters have been updated. Comprehensive - Part I provides a conceptual overview of standard setting and its overarching issues; Part II provides practical (how-to) information on the newest standard setting methods; Part III provides information and advice on persistent and potential challenges in standard

setting. Practical – Part II (the heart of the book) reviews 16 of the newest standard setting methods, far more than any other book. Expertise – Most of the well-known authors from the 1st edition return, with authors of equal stature contributing new chapters.

There are two aspects to the theory of Boolean algebras; the algebraic and the set-theoretical. A Boolean algebra can be considered as a special kind of algebraic ring, or as a generalization of the set-theoretical notion of a field of sets. Fundamental theorems in both of these directions are due to M. H. STONE, whose papers have opened a new era in the development of this theory. This work treats the set-theoretical aspect, with little mention being made of the algebraic one. The book is composed of two chapters and an appendix. Chapter I is devoted to the study of Boolean algebras from the point of view of finite Boolean operations only; a greater part of its contents can be found in the books of BIRKHOFF [2] and HERMES [1]. Chapter II seems to be the first systematic study of Boolean algebras with infinite Boolean operations. To understand Chapters I and II it suffices only to know fundamental notions from general set theory and set-theoretical topology. No knowledge of lattice theory or of abstract algebra is presumed. Less familiar topological theorems are recalled, and only a few examples use more advanced topological means; but these may be omitted. All theorems in both chapters are given with full proofs.
