Cyber Security and Global Information Assurance: Threat Analysis and Response Solutions

As well as highlighting potentially useful applications for network analysis, this volume identifies new targets for mathematical research that promise to provide insights into network systems theory as well as facilitating the cross-fertilization of ideas between sectors. Focusing on financial, security and social aspects of networking, the volume adds to the growing body of evidence showing that network analysis has applications to transportation, communication, health, finance, and social policy more broadly. It provides powerful models for understanding the behavior of complex systems that, in turn, will impact numerous cutting-edge sectors in science and engineering, such as wireless communication, network security, distributed

computing and social networking, financial analysis, and cyber warfare. The volume offers an insider's view of cutting-edge research in network systems, including methodologies with immense potential for interdisciplinary application. The contributors have all presented material at a series of workshops organized on behalf of Canada's MITACS initiative, which funds projects and study grants in 'mathematics for information technology and complex systems'. These proceedings include papers from workshops on financial networks, network security and cryptography, and social networks. MITACS has shown that the partly ghettoized nature of network systems research has led to duplicated work in discrete fields, and thus this initiative has the potential to save time and accelerate the pace of research in a number of areas of network systems research.

Network Analysis and Synthesis

In networks today, organizations are faced with hundreds of new web and non-web applications that are available to their users. Social media applications, peer-to-peer file transfer applications, Voice over Internet Protocol (VoIP), web-based email, cloud data storage, and many others are all readily available. The ease and speed at which these new applications can be installed or simply accessed reduces the effectiveness of a perimeter-based security

architecture and provides many new types of risks. These applications can be used by an attacker to obtain initial access into the organization and bypass any perimeter-based security. This IBM® Redguide™ publication introduces the solution, which is a (IPS) that extends the capabilities of traditional protocol-based IPSes by providing application visibility and control. By using IBM X-Force® Research And Development, this solution provides critical insight and control of all user activities by analyzing each connection to identify the web or non-web application in use and the action being taken. The IBM Security Network Protection solution can then decide to allow or block the connection, and can inspect even those connections that are encrypted by SSL. Additionally, the X-Force IP Reputation information can be used to understand whether sites that are accessed are hosting malware, are BotNet Command and Control servers (C&C servers), or are phishing sites, and other important information. The IBM Security Network Protection can record connection information, including user and application context, and can use this information for local policy refinement, including bandwidth management. Alternatively, the connection information can be sent to a (SIEM) for security analysis and longer term storage. The IBM Security Network Protection consolidation of the traditional IPS function, in combination with sophisticated user-based application control and IP Reputation, can provide an integrated security solution. This approach allows for faster deployment and simplification of the administration that is associated with the deployment of multiple products, reduces the cost of ownership and complexity, and

provides for better return on investment (ROI). The target audience for this publication is business leaders, decision makers, network managers, IT security managers, and IT and business consultants.

Neural Network Analysis, Architectures and Applications discusses the main areas of neural networks, with each authoritative chapter covering the latest information from different perspectives. Divided into three parts, the book first lays the groundwork for understanding and simplifying networks. It then describes novel architectures and algorithms, including pulse-stream techniques, cellular neural networks, and multiversion neural computing. The book concludes by examining various neural network applications, such as neuron-fuzzy control systems and image compression. This final part of the book also provides a case study involving oil spill detection. This book is invaluable for students and practitioners who have a basic understanding of neural computing yet want to broaden and deepen their knowledge of the field.

Network Analysis, Architecture and Design

Using wireless sensor networks as part of pervasive computing scenarios is a difficult problem. It involves providing functionality and node behavior required by pervasive computing applications given the very limited capabilities and the constraints of wireless sensor nodes. The goal of this work is to investigate the problem of integrating wireless sensor nodes and

wireless sensor networks in pervasive computing scenarios and to develop solutions that facilitate such an integration. Based on an analysis of both research areas, of their specific properties and requirements as well as the similarities and differences of the two fields, we identify and discuss a set of five fundamental problem areas that complicate the integration of sensor networks and pervasive computing: communication, network setup and configuration, user experience, security and flexibility and adaptability. In the main part of this work, we then introduce a total of six solution approaches that deal with different aspects of the identified problem areas.

MICHEL GENDREAU AND PATRICE MARCOTTE As an academic, Michael Florian has always stood at the forefront of transportation research. This is reflected in the miscellaneous contributions that make the chapters of this book, which are related in some way or another to Michael's interests in both the theoretical and practical aspects of his field. These interests span the areas of Traffic Assignment, Network Equilibrium, Shortest Paths, Railroad problems, De mand models, Variational Inequalities, Intelligent Transportation Systems, etc. The contributions are briefly outlined below. BASSANINI, LA BELLA AND NASTASI determine a track pricing policy for railroad companies through the solution of a generalized Nash game. BEN-AKIVA, BIER LAIRE, KOUTSOPOULOS AND MISHALANI discuss simulation-based estimators of the interactions between supply

BROTCORNE, DE WOLF, GENDREAU AND LABBE present a discrete model of dynamic traffic assignment where flow departure is endogenous and the First-In-First-Out condition is strictly enforced. CASCETTA AND IMP ROTA give a rigorous treatment of the problem of estimating travel demand from observed data, both in the static and dynamic cases. CRAINIC, DUFOUR, FLO RIAN AND LARIN show how to obtain path information that is consistent with the link information provided by a nonlinear multimodal model. ERLANDER derives the logit model from an efficiency principle rather than from the classical random utility approach.
