The first water-cooled Porsche Turbos were launched in 1979, evolving through Turbo variants of the front-engined 924, 944 and 968. With the new Millennium came the first of the water-cooled rear-engined 922 Turbos, and from 2017 turbos have been applied to the mid engine Boxster and Cayman models. Johnny Tipler describes the progression of these popular cars from their introduction to the present day. Included are interviews with Derek Bell, Jacky Ickx, Walter Rohrl, Allan McNish, Jorg Bergmeister and Hans-Joachim Stuck. Full development and design history for all seven models is given along with specification tables and detailed motorsport achievements.

"In the 1930s, when gas turbines were practically unknown, engine designers worldwide struggled to create a new and more powerful generation of aircraft engines. It was hoped these engines would push aircraft to speeds of more than 500 miles per hour. One such engine, the Tornado, was a remarkable 42-cylinder liquid-cooled radial conceived by the Wright Aeronautical Corporation."--Page 4 of cover.

An analysis based on forced-convection heat-transfer theory, similar to the analysis presented for air-cooled engines in NACA Report No. 612, is made of the cooling processes in liquid-cooled engine cylinders. Semi-empirical equations that relate the average head and barrel temperatures with the primary engine and coolant parameters are derived.
